Note: This revised section to be filed into the Service Manual to replace the section 'Tube Conditioning'.

1x.1 Tube adjustment

1x.1 Conditioning of the tube(s)

⚠ **Warning!   Radiation is released during the procedure!**

This procedure must be performed for each new installation, tube replacement, but also if a symptom points to any kind of tube arcing.

Precondiontions / Programmings:

For Optimus RAD & R/F (CU release 3.x)	**For Optimus C (Duo Diagnost)**
• Perform the following programmings temporarily for each tube connected to one of the assigned RGDV = Free cassette: XRGSCOPE PROGRAM→REGISTRATION DEVICES→RGDV#→DATA SET A:	Note: No change of programming is required.

	Temporarily:	Original:Tube1,2,3
Enable handswitch....	**YES**	Verify the
Synchmaster present	**NO**	custimezed
Exposure switch type	**Double Step**	entries
Exposure series / Tomo...	**YES**	in 2Z-2.x
Mounted radiographical..	**NONE**	

• Reset the generator
• Select appropriate programmed RGDV 'Free cassette' for each tube to be break in.

• Select Registration Device ‚Free cassette' for this tube.

Procedure:

• Select <u>large</u> focus
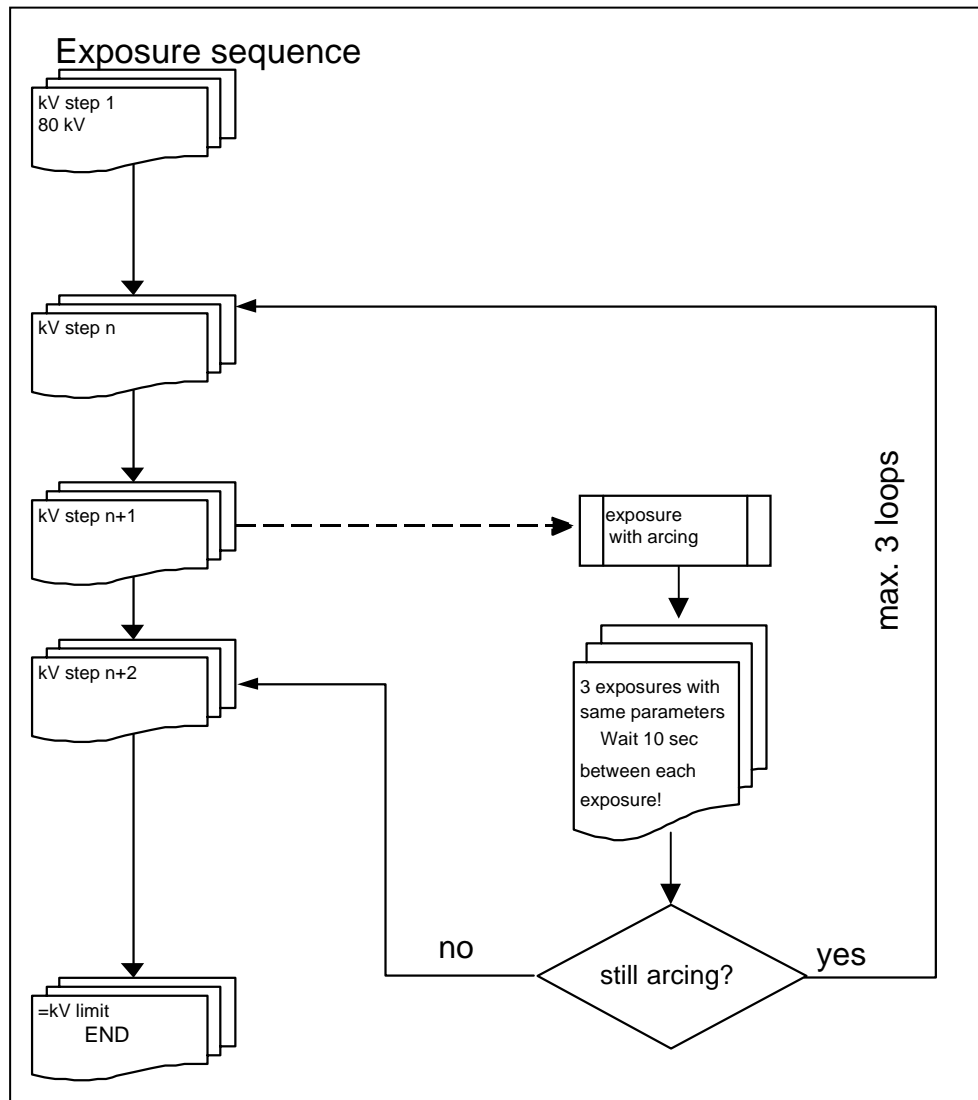

Note: The generator must be in the READY state.

• Run reconditioning procedure for an adapted tube, refer to the table 'Exposure data set for conditioning', left column 'Tube adapted'.
or
• Run conditioning procedure for a new or non-adapted tube, refer to the table 'Exposure data set for conditioning' , right column 'Tube <u>not</u> adapted'.

• It is recommended to monitor the high tension during conditioning. Connect the scope:
Channel1: kV *AV HT* at EZ 130 X3 (1V/div), scale: 20kV/V
Trigger external: *CTRL_X_C/* at backpanel EZ X74, negative slope
Time base: 2ms/div.

• In case of problems like tube arching see flowchart 'Exposure sequence' as an example, apply for applicable kV range only:
i.e. 109 kV is the max kV value for normal application, perform just up to next higher kV step = 117kV.
Notes (refer to flow chart 'Exposure sequence'): If the tube arcs at a certain kV value, conduct another 3 exposures with same parameters and 10 s pause between subsequent exposures. In case of success (no arcing anymore) continue with next kV step of the table "Exposure data set...".
If the last exposure still arcs go one kV step back and follow normal procedure. If this routine has been performed three times without improvement; → replace the tube.

Exposure parameter for conditioning

=kV limit       no └──────  ◇ still arcing? ◇  yes ─┘
  END
```

Note: If a tube arcs at a kV value which is not required for application the max kV (e.g.117kV) program this new limit value via

XRGSCOPE
Program → Tubes → Tube Limits → Max. Tube Voltage Limit [kV]: [**117**].

Since the limit value got reduced by this reason, a following re-adaptation procedure will set the field *'Adapted To [kV]'* to this value as well.

- Set RGDV programming to original status if no adaptation procedure has to be executed.

- Reset the generator

(Note: **If adjustment 'factor for duty cycle' was interrupted by tube arcing, return to that procedure now.)**
